

NowCart.

Reimagining **Urgent** Shopping

Quick commerce solved delivery. We solve the deciding.

Team **Codysey**

The Bottleneck in Quick Commerce

5-7 Min

Decision time

Time spent per order just searching, comparing, and finding substitutes (RedSeer, 2025)

1-by-1

Manual picking

Every platform still forces users to select items one at a time

70%

Cart abandonment

70% Cart abandonment rate due to friction (Dynamic Yield, 2025)

Delivery is fast, automated, and solved.
Deciding what to buy is still slow, manual, and unsolved.

Every platform searches. NowCart reasons.

The Old Way

1. Product-first search

Manual browsing, item-by-item selection with every single order.

2. Out-of-stock

Start over with no substitution or fallback provided, user searches again from scratch.

3. No memory, no help

Past orders don't inform the next cart. Every session starts from zero.

The NowCart Way

1. Informed choice, not forced choice

NowCart Verified badge (most ordered + highest rated). No brand bias, no hidden AI selection.

2. Recommended + Economical, always

Every cart shows the best pick alongside the cheapest in-stock alternative with exact saving shown.

3. Integration-ready

Voice via Alexa, image via Amazon Photos, engine exposed as an API that plugs into existing ecosystems

Understanding NowCart's Target Audience

Never-in-the-Kitchen People

Wants to cook something they saw online, but doesn't know the recipe or ingredients needed.

Elderly / Voice-First Users

Can't navigate text-heavy apps & struggles with small buttons, typing, and multi-screens to place a simple order.

General Household Shopper

Knows what to cook, but spends time searching items, comparing brands, and finding substitutes when out of stock.

Five ways in.

One confident cart out.

"Outcome Engine" with a subline "
decompose → match → score"

Show

Snap a dish photo → ingredients
extracted, cart built

Share

Paste a recipe or YouTube link
→ recipe parsed, cart built"

Speak

"Say 'biryani for 4' → intent
understood, cart built"

Constrain

"Set a budget (e.g. ₹500) → best
picks selected, cart fits budget"

Subscribe

"Set recurring items, or do nothing →
restocks predicted before you ask"

"One Confident Cart"

Customer
order delivered • journey complete

Legend

Solid line:
always happens,
in this order

Dashed line:
happens
conditionally

Technical Architecture

The NowCart Tech Stack

IMPACT

- **Frontend** : Instant, lag-free UI for shoppers
- **Backend**: Handles 1000+ concurrent load at scale; pydantic blocks malicious input by default.
- **AI / ML**: Multi-model reasoning engine that converts any intent into a precise cart
- **Databases**: Auto-scales with zero ops, powers restock predictions from order history
- **Infrastructure** : Fast global delivery, instant cache hits, and offloaded AI keep the app responsive at peak traffic.

Algorithms & Scaling Strategy

Additional Components

Subscribe (Predictive Restock)

Predicts restock timing from purchase patterns using pure statistics, no training needed

Database

DynamoDB auto-scales reads/writes on-demand so Global Tables extend it across regions

Frontend

S3 + CloudFront already serve globally from edge locations

Provider Abstraction

Swapping LLM providers is a single environment variable also supports any API (Groq, Bedrock, etc.)

Future Vision

1. Expansion Roadmap

0-3 mo: 1000 active users, 3 times faster cart assembly, less than 15% abandonment

3-6 mo: 10K+ users; multi-language voice unlocks access for 500M+ non-English speakers (IAMAI, 2024)

6-12 mo: 20k+ users, licensing revenue per cart built, need → done layer proven

Full Scale Launch

Every way to build a cart, live with real users in many cities.

OTC Pharmacy Catalog Integration

Multi-language voice and predictive restock are integrated.

Enterprise Restocking & Integrations

B2B restocking for restaurants/offices + travel kits + white-label API.

2. Multi-Segment Growth & Value Impact

Our technical advantage is a domain-agnostic engine that scales without rebuilds

Pharmacy & Health:

High-urgency medicine and comfort kits; same pipeline, new catalogue.

B2B Restocking:

Bulk orders for restaurants and offices with budget limits and auto-orders.

Time Saved:

26 hours returned per user annually; 26M+ hours given back at 1M users.

Creator Commerce:

Turning cooking videos and reels into shoppable carts via URL parsing.

Users Reached:

1.4B+ (Statista, 2023) global shoppers +200M across new segments; voice/photo unlocks 100M+ excluded users

Efficiency Gains:

Solves the 70% cart-abandonment problem; caching cuts 99% of model costs; white-label pricing adds six-figure monthly licensing potential

Thank You
